#### Abstract

In this paper we study characterizations of odd and even dimensional mixed super quasiEinstein manifold and we give three and four dimensional examples (both Riemannian and Lorentzian) of mixed super quasi-Einstein manifold to show the existence of such manifold. Also in the last section we give the examples of warped product on mixed super quasi-Einstein manifold.

Keywords. Einstein manifold, quasi-Einstein manifold, super quasi-Einstein manifold, mixed super quasi-Einstein manifold, pseudo generalized quasi Einstein manifold, warped product..

## 1 Introduction

A Riemannian manifold $(M, g)$ with dimension $(n \geq 2)$ is said to be an Einstein manifold if it satisfies the condition $S(X, Y)=\frac{r}{n} g(X, Y)$, holds on $M$, here $S$ and $r$ denote the Ricci tensor and the scalar curvature of $(M, g)$ respectivley. According to [2] the above equation is called the Einstein metric condition. Einstein manifolds play an important role in Riemannian Geometry, as well as in general theory of relativity. The notion of quasi-Einstien manifold was defined in [7]. A non-flat Riemannian manifold $(M, g),(n \geq 2)$ is said to be an quasi Einstein manifold if the condition $S(X, Y)=\alpha g(X, Y)+\beta \rho(X) \rho(Y)$, is fulfilled on $M$, where $\alpha$ and $\beta$ are scalars of which $\beta \neq 0$ and $\rho$ is non-zero 1-form such that $g(X, \xi)=\rho(X)$ for all vector field $X$ and $\xi$ is a unit vector field.

In [5], M.C.Chaki introduced super quasi-Einstein manifold, denoted by $S(Q E)_{n}$ and gave an example of a 4-dimensional semi Riemannian super quasi-Einstein manifold, where the Ricci tensor $S$ of type $(0,2)$ which is not identically zero satisfies the condition
$S(X, Y)=\alpha g(X, Y)+\beta A(X) A(Y)+\gamma[A(X) B(Y)+A(Y) B(X)]+\delta D(X, Y)$,
where $\alpha, \beta, \gamma, \delta$ are scalars such that $\beta, \gamma, \delta$ are nonzero and $A, B$ are two nonzero 1 -forms such that $g\left(X, \xi_{1}\right)=A(X)$ and $g\left(X, \xi_{2}\right)=B(X), \xi_{1}, \xi_{2}$ being unit vectors which are orthogonal, i.e., $g\left(\xi_{1}, \xi_{2}\right)=0$ and $D$ is symmetric $(0,2)$ tensor with zero trace which satisfies the condition $D\left(X, \xi_{1}\right)=0, \forall X \in \chi(M)$.

Here $\alpha, \beta, \gamma, \delta$ are called the associated scalars , and $A, B$ are called the associated main and auxiliary 1-forms respectively, $\xi_{1}, \xi_{2}$ are main and auxiliary generators and $D$ is called the associated tensor of the manifold.

In [3], A.Bhattacharyya, M.Tarafdar and D.Debnath introduced the notion of mixed super quasiEinstein manifold, denoted by $M S(Q E)_{n}$ with an example. A non-flat Riemannian manifold $(M, g)$, $(n \geq 3)$ is called mixed super quasi-Einstein manifold if its the Ricci tensor $S$ of type $(0,2)$ is not identically zero and satisfies the condition

$$
\begin{align*}
S(X, Y) & =\alpha g(X, Y)+\beta A(X) A(Y)+\varrho B(X) B(Y) \\
& +\gamma[A(X) B(Y)+A(Y) B(X)]+\delta D(X, Y) \tag{1.2}
\end{align*}
$$

where $\alpha, \beta, \varrho, \gamma, \delta$ are scalars such that $\beta, \varrho, \gamma, \delta$ are nonzero and $A, B$ are two nonzero 1 -forms such that
$g\left(X, \xi_{1}\right)=A(X), g\left(X, \xi_{2}\right)=B(X), g\left(\xi_{1}, \xi_{2}\right)=0, \forall X$
$\xi_{1}, \xi_{2}$ being unit vectors which are orthogonal, $D$ is symmetric $(0,2)$ tensor which satisfies the condition
$D\left(X, \xi_{1}\right)=0$, trace $D=0 \forall X \in \chi(M)$.

Here $\alpha, \beta, \varrho, \gamma, \delta$ are called the associated scalars, and $A, B$ are called the associated main and auxiliary 1-forms respectively, $\xi_{1}, \xi_{2}$ are main and auxiliary generators and $D$ is called the associated tensor of the manifold.

In [11], A.A.Shaikh, S.Jana introduced the notion of pseudo generalized quasi-Einstein manifold, denoted by $P(G Q E)_{n}$ with examples. A non-flat Riemannian manifold $(M, g),(n>2)$ is called pseudo generalized quasi Einstein manifold if its the Ricci tensor $S$ of type ( 0,2 ) is not identically zero and satisfies the condition
$S(X, Y)=\alpha g(X, Y)+\beta A(X) A(Y)+\varrho B(X) B(Y)+\delta D(X, Y)$,
where $\alpha, \beta, \varrho$ and $\delta$ are nonzero and $A, B$ are two nonzero 1-forms such that
$g\left(X, \xi_{1}\right)=A(X), g\left(X, \xi_{2}\right)=B(X), g\left(\xi_{1}, \xi_{2}\right)=0, \forall X$,
$\xi_{1}, \xi_{2}$ being unit vectors which are orthogonal, $D$ is symmetric $(0,2)$ tensor which satisfies the condition

$$
\begin{equation*}
D\left(X, \xi_{1}\right)=0, \text { trace } D=0 \forall X \in \chi(M) \tag{1.7}
\end{equation*}
$$

Here $\alpha, \beta, \varrho, \delta$ are called the associated scalars, and $A, B$ are called the associated 1 -forms of the
manifold and $D$ is called the structure tensor of the manifold.
Let $M$ be an $m$-dimensional, $m \geq 3$, Riemannian manifold and $p \in M$. Denote by $K(\pi)$ or $K(U \wedge V)$ the sectional curvature of $M$ associated with a plane section $\pi \subseteq T_{p} M$, where $\{U, V\}$ is an orthonormal basis of $\pi$. For a $n$-dimensional subspace $L \subseteq T_{p} M, 2 \leq n \leq m$, its scalar cuvrvature $\tau(L)$ is denoted by $\tau(L)=\sum_{1 \leq i<j \leq n} K\left(e_{i} \wedge e_{j}\right)$, where $\left\{e_{1}, e_{2}, \ldots, e_{n}\right\}$ is any orthonormal basis of $L$ ([8]).
The notion of warped product generalizes that of a surface of revolution. It was introduced in [4], for studying manifolds of negative curvature. Let $\left(B, g_{B}\right),\left(F, g_{F}\right)$ be two Riemannian manifolds with $\operatorname{dim} B=m>0, \operatorname{dim} F=k>0$ and $f: B \longrightarrow(0, \infty), f \in C^{\infty}(B)$. The warped product $M=B \times_{f} F$ is the Riemannian manifold $B \times F$ furnished with the metric $g_{M}=g_{B}+f^{2} g_{F} . B$ is called the base of $M, F$ is the fibre and the warped product is called a simply Riemannian product if $f$ is a constant function. The function $f$ is called the warping function of the warped product[10].

The well-known characterization of 4-dimensional Einstein spaces was given by Singer and Thorpe in [12]. Later we have seen that the generalization of 4 -dimensional Einstein spaces was given by Chen in [6]. On the other hand, in [8] Dumitru obtained the result for odd dimensional Einstein spaces. Also these results (both odd and even dimensions) were generalized to quasi Einstein manifold by Bejan in [1]. Also characterization of super quasi-Einstein manifold for both of odd and even dimensions was studied in [9]. From above studies, we have given characterization of mixed super quasi-Einstein manifold for both of odd and even dimensions with three and four dimensional examples of mixed super quasi-Einstein manifold to ensure the existence of such manifold. Next we show that a mixed super quasi-Einstein manifold is pseudo generalized quasi Einstein manifold if either of generators is parallel vector field. In the last section we have given examples of warped product on mixed super quasi-Einstein manifold.

## 2. Characterization of mixed super quasi-Einstein manifold

In this section we establish the characterization of odd and even dimensional $M S(Q E)_{n}$.
Theorem 2.1. A Riemannian manifold of dimension ( $2 n+1$ ) with $n \geq 2$ is mixed super quasi Einstein manifold if and only if the Ricci operator $Q$ has eigen vector fields $\xi_{1}$ and $\xi_{2}$ such that at any point $p \in M$, there exist three real numbers $a, b$ and $c$ satisfying

$$
\begin{aligned}
& \tau(P)+a=\tau\left(P^{\perp}\right) ; \quad \xi_{1}, \xi_{2} \in T_{p} P^{\perp}, \\
& \tau(N)+b=\tau\left(N^{\perp}\right) ; \quad \xi_{1} \in T_{p} N, \xi_{2} \in T_{p} N^{\perp} \\
& \tau(R)+c=\tau\left(R^{\perp}\right) ; \quad \xi_{1} \in T_{p} R, \xi_{2} \in T_{p} R^{\perp}
\end{aligned}
$$

for any $n$-plane sections $P, N$ and $(n+1)$-plane section $R$ where $P^{\perp}, N^{\perp}$ and $R^{\perp}$ denote the orthogonal complements of $P, N$ and $R$ in $T_{p} M$ respectively and

$$
\begin{aligned}
a=\{\alpha+\beta & \left.+\varrho+\delta\left[\sum_{i=n+1}^{2 n-1} D\left(e_{i}, e_{i}\right)+D\left(e_{2 n+1}, e_{2 n+1}\right)-\sum_{i=1}^{n} D\left(e_{i}, e_{i}\right)\right]\right\} / 2, \\
b & =\left\{\alpha-\beta+\varrho+\delta\left[\sum_{i=n+1}^{2 n+1} D\left(e_{i}, e_{i}\right)-\sum_{i=1}^{n-1} D\left(e_{i}, e_{i}\right)\right]\right\} / 2, \\
c & =\left\{\varrho-\alpha-\beta+\delta\left[\sum_{i=n+2}^{2 n+1} D\left(e_{i}, e_{i}\right)-\sum_{i=1}^{n} D\left(e_{i}, e_{i}\right)\right]\right\} / 2
\end{aligned}
$$

where $\alpha, \beta, \varrho$ and $\delta$ are scalars.

Proof. First suppose that $M$ is a $(2 n+1)$ dimensional mixed super quasi Einstein manifold, so

$$
\begin{align*}
S(X, Y)=\alpha & \alpha(X, Y)+\beta A(X) A(Y)+\varrho B(X) B(Y) \\
& +\gamma[A(X) B(Y)+A(Y) B(X)]+\delta D(X, Y), \tag{2.1}
\end{align*}
$$

where $\alpha, \beta, \varrho, \gamma, \delta$ are scalars such that $\beta, \varrho, \gamma, \delta$ are nonzero and $A, B$ are two nonzero 1 -forms such that $g\left(X, \xi_{1}\right)=A(X)$ and $g\left(X, \xi_{2}\right)=B(X), \xi_{1}, \xi_{2}$ being unit vectors which are orthogonal, i.e., $g\left(\xi_{1}, \xi_{2}\right)=0$ and $D$ is symmetric $(0,2)$ tensor with zero trace which satisfies the condition $D\left(X, \xi_{1}\right)=0, \forall X \in \chi(M)$.

Let $P \subseteq T_{p} M$ be an $n$-dimensional plane orthogonal to $\xi_{1}, \xi_{2}$ and let $\left\{e_{1}, e_{2} \ldots \ldots . e_{n}\right\}$ be orthonormal basis of it. Since $\xi_{1}$ and $\xi_{2}$ are orthogonal to $P$, we can take orthonormal basis $\left\{e_{n+1}, e_{n+2} \ldots \ldots . e_{2 n+1}\right\}$ of $P^{\perp}$ such that $e_{2 n}=\xi_{1}$ and $e_{2 n+1}=\xi_{2}$. Thus $\left\{e_{1}, e_{2} \ldots \ldots . e_{n}, e_{n+1}, e_{n+2} \ldots \ldots . e_{2 n+1}\right\}$ is an orthonormal basis of $T_{p} M$. Then we can take $X=Y=e_{i}$ in (2.1), we have

$$
S\left(e_{i}, e_{i}\right)=\sum_{j=1}^{2 n+1} R\left(e_{j}, e_{i}, e_{i}, e_{j}\right)=\left\{\begin{array}{ccc}
\alpha+\delta D\left(e_{i}, e_{i}\right), & \text { for } & 1 \leq i \leq 2 n-1 \\
\alpha+\beta, & \text { for } & i=2 n \\
\alpha+\varrho+\delta D\left(\xi_{2}, \xi_{2}\right), & \text { for } & i=2 n+1
\end{array}\right.
$$

By use of (2.1) for any $1 \leq i \leq 2 n+1$, we can write

$$
\begin{aligned}
& S\left(e_{1}, e_{1}\right)=K\left(e_{1} \wedge e_{2}\right)+K\left(e_{1} \wedge e_{3}\right)+\ldots \ldots \ldots . .+K\left(e_{1} \wedge e_{2 n-1}\right) \\
& +K\left(e_{1} \wedge \xi_{1}\right)+K\left(e_{1} \wedge \xi_{2}\right)=\alpha+\delta D\left(e_{1}, e_{1}\right) \\
& S\left(e_{2}, e_{2}\right)=K\left(e_{2} \wedge e_{1}\right)+K\left(e_{2} \wedge e_{3}\right)+\ldots \ldots \ldots \ldots+K\left(e_{2} \wedge e_{2 n-1}\right) \\
& +K\left(e_{2} \wedge \xi_{1}\right)+K\left(e_{2} \wedge \xi_{2}\right)=\alpha+\delta D\left(e_{2}, e_{2}\right)
\end{aligned}
$$

$$
S\left(e_{2 n-1}, e_{2 n-1}\right)=K\left(e_{2 n-1} \wedge e_{1}\right)+K\left(e_{2 n-1} \wedge e_{2}\right)+K\left(e_{2 n-1} \wedge e_{3}\right)
$$

$$
\begin{aligned}
& \quad+\ldots \ldots \ldots \ldots+K\left(e_{2 n-1} \wedge \xi_{2}\right)=\alpha+\delta D\left(e_{2 n-1}, e_{2 n-1}\right) \\
& S\left(\xi_{1}, \xi_{1}\right)=K\left(\xi_{1} \wedge e_{1}\right)+K\left(\xi_{1} \wedge e_{2}\right)+\ldots \ldots \ldots \ldots \ldots+K\left(\xi_{1} \wedge e_{2 n-1}\right) \\
& +K\left(\xi_{1} \wedge \xi_{2}\right)=\alpha+\beta \\
& S\left(\xi_{2}, \xi_{2}\right)=K\left(\xi_{2} \wedge e_{1}\right)+K\left(\xi_{2} \wedge e_{2}\right)+\ldots \ldots \ldots \ldots \ldots .+K\left(\xi_{2} \wedge e_{2 n-1}\right) \\
& +K\left(\xi_{2} \wedge \xi_{1}\right)=\alpha+\varrho+\delta D\left(\xi_{2}, \xi_{2}\right) .
\end{aligned}
$$

Adding first $n$-equations, we get

$$
\begin{equation*}
2 \tau(P)+\sum_{1 \leq i \leq n<j \leq 2 n+1} K\left(e_{i} \wedge e_{j}\right)=n \alpha+\delta \sum_{i=1}^{n} D\left(e_{i}, e_{i}\right) . \tag{2.2}
\end{equation*}
$$

Then adding the last $(n+1)$ equations, we have

$$
\begin{align*}
2 \tau\left(P^{\perp}\right)+ & \sum_{1 \leq j \leq n<i \leq 2 n+1} K\left(e_{i} \wedge e_{j}\right)=(n+1) \alpha+\beta+\varrho \\
& +\delta \sum_{i=n+1}^{2 n-1} D\left(e_{i}, e_{i}\right)+\delta D\left(\xi_{2}, \xi_{2}\right) \tag{2.3}
\end{align*}
$$

Then, by substracting the equation (2.2) and (2.3), we obtain

$$
\tau\left(P^{\perp}\right)-\tau(P)=\left\{\alpha+\beta+\varrho+\delta\left[\sum_{i=n+1}^{2 n-1} D\left(e_{i}, e_{i}\right)+D\left(e_{2 n+1}, e_{2 n+1}\right)-\Sigma_{i=1}^{n} D\left(e_{i}, e_{i}\right)\right]\right\}
$$

Therefore $\tau(P)+a=\tau\left(P^{\perp}\right)$, where,

$$
a=\left\{\alpha+\beta+\varrho+\delta\left[\sum_{i=n+1}^{2 n-1} D\left(e_{i}, e_{i}\right)+D\left(e_{2 n+1}, e_{2 n+1}\right)-\sum_{i=1}^{n} D\left(e_{i}, e_{i}\right)\right]\right\} / 2
$$

Similarly, Let $N \subseteq T_{p} M$ be an $n$-dimensional plane orthogonal to $\xi_{2}$ and let $\left\{e_{1}, e_{2} \ldots \ldots . e_{n}\right\}$ be orthonormal basis of it. Since $\xi_{2}$ is orthogonal to $N$, we can take an orthonormal basis $\left\{e_{n+1}, e_{n+2} \ldots \ldots . . e_{2 n+1}\right\}$ of $N^{\perp}$ orthogonal to $\xi_{1}$, such that $e_{n}=\xi_{1}$ and $e_{2 n+1}=\xi_{2}$, respectively. Thus, $\left\{e_{1}, e_{2} \ldots \ldots . e_{n}, e_{n+1}, e_{n+2} \ldots \ldots . e_{2 n+1}\right\}$ is an orthonormal basis of $T_{p} M$. Then we can take $X=Y=e_{i}$ in (2.1) to have

$$
S\left(e_{i}, e_{i}\right)=\sum_{j=1}^{2 n+1} R\left(e_{j}, e_{i}, e_{i}, e_{j}\right)=\left\{\begin{array}{cc}
\alpha+\delta D\left(e_{i}, e_{i}\right), & 1 \leq i \leq n-1 \\
\alpha+\beta, & i=n \\
\alpha+\delta D\left(e_{i}, e_{i}\right), & n+1 \leq i \leq 2 n \\
\alpha+\varrho+\delta D\left(e_{2 n+1}, e_{2 n+1}\right), & i=2 n+1
\end{array}\right.
$$

Adding first $n$-equations, we get
$2 \tau(N)+\sum_{1 \leq i \leq n<j \leq 2 n+1} K\left(e_{i} \wedge e_{j}\right)=n \alpha+\beta+\delta \sum_{i=1}^{n-1} D\left(e_{i}, e_{i}\right)$,
and adding the last $(n+1)$ equations, we have
$2 \tau\left(N^{\perp}\right)+\sum_{1 \leq j \leq n<i \leq 2 n+1} K\left(e_{i} \wedge e_{j}\right)=(n+1) \alpha+\varrho+\delta \sum_{i=n+1}^{2 n+1} D\left(e_{i}, e_{i}\right)$.

Then, by substracting the equation (2.4) and (2.5), we obtain

$$
\tau\left(N^{\perp}\right)-\tau(N)=\left\{\alpha-\beta+\varrho+\delta\left[\sum_{i=n+1}^{2 n+1} D\left(e_{i}, e_{i}\right)-\sum_{i=1}^{n-1} D\left(e_{i}, e_{i}\right)\right]\right\} / 2
$$

Therefore $\tau(N)+b=\tau\left(N^{\perp}\right)$, where,

$$
b=\left\{\alpha-\beta+\varrho+\delta\left[\sum_{i=n+1}^{2 n+1} D\left(e_{i}, e_{i}\right)-\sum_{i=1}^{n-1} D\left(e_{i}, e_{i}\right)\right]\right\} / 2
$$

Analogously, Let $R \subseteq T_{p} M$ be an ( $n+1$ )-plane orthogonal to $\xi_{2}$ and let $\left\{e_{1}, e_{2}, \ldots, e_{n+1}\right\}$ be orthonormal basis of it. Since $\xi_{2}$ is orthogonal to $R$, we can take an orthonormal basis $\left\{e_{n+2}, e_{n+3}, \ldots, e_{2 n}\right.$, $\left.e_{2 n+1}\right\}$ of $R^{\perp}$ orthogonal to $\xi_{1}$, such that $e_{n+1}=\xi_{1}$ and $e_{2 n+1}=\xi_{2}$. Thus,

$$
\left\{e_{1}, e_{2}, \ldots, e_{n}, e_{n+1}, e_{n+2}, \ldots, e_{2 n+1}\right\}
$$

is an orthonormal basis of $T_{p} M$. Then we can take $X=Y=e_{i}$ in (2.1) to have

$$
S\left(e_{i}, e_{i}\right)=\sum_{j=1}^{2 n+1} R\left(e_{j}, e_{i}, e_{i}, e_{j}\right)=\left\{\begin{array}{cc}
\alpha+\delta D\left(e_{i}, e_{i}\right), & 1 \leq i \leq n \\
\alpha+\beta, & i=n+1 \\
\alpha+\delta D\left(e_{i}, e_{i}\right), & n+2 \leq i \leq 2 n \\
\alpha+\varrho+\delta D\left(e_{2 n+1}, e_{2 n+1}\right), & i=2 n+1
\end{array}\right.
$$

Adding the first $n+1$-equations, we get
$2 \tau(R)+\sum_{1 \leq i \leq n+1<j \leq 2 n+1} K\left(e_{i} \wedge e_{j}\right)=(n+1) \alpha+\beta+\delta \sum_{i=1}^{n} D\left(e_{i}, e_{i}\right)$,
and adding the last $n$ equations, we have
$2 \tau\left(R^{\perp}\right)+\sum_{1 \leq j \leq n+1<i \leq 2 n+1} K\left(e_{i} \wedge e_{j}\right)=n \alpha+\varrho+\delta \sum_{i=n+2}^{2 n+1} D\left(e_{i}, e_{i}\right)$.

Then, by substracting the equation (2.6) and (2.7), we obtain

$$
\tau\left(R^{\perp}\right)-\tau(R)=\left\{\varrho-\alpha-\beta+\delta\left[\sum_{i=n+2}^{2 n+1} D\left(e_{i}, e_{i}\right)-\sum_{i=1}^{n} D\left(e_{i}, e_{i}\right)\right]\right\} / 2 .
$$

Therefore $\tau(R)+c=\tau\left(R^{\perp}\right)$, where,

$$
c=\left\{\varrho-\alpha-\beta+\delta\left[\sum_{i=n+2}^{2 n+1} D\left(e_{i}, e_{i}\right)-\sum_{i=1}^{n} D\left(e_{i}, e_{i}\right)\right]\right\} / 2 .
$$

Conversely, let $g(l X, Y)=D(X, Y)$, where $l$ is a symmetric endomorphism of the tangent space $T_{p} M$ and let $V$ be an arbitrary unit vector of $T_{p} M$, at $p \in M$, orthogonal to $\xi_{1}$ and $\xi_{2}$. Now $D$ is symmetric as $g$ is so, trace of $D$ is zero and $D\left(X, \xi_{1}\right)=0$ for all $X \in \chi(M)$. We take an orthonormal basis $\left\{e_{1}, e_{2} \ldots \ldots . e_{n}, e_{n+1}, e_{n+2} \ldots \ldots . e_{2 n+1}\right\}$ of $T_{p} M$ such that $V=e_{1}, e_{n+1}=\xi_{1}$ and $e_{2 n+1}=\xi_{2}$. We consider $n$-plane section $N$ and ( $n+1$ )-plane section $R \operatorname{in} T_{p} M$ as follows $N=\operatorname{span}\left\{e_{2} \ldots \ldots . e_{n}, e_{n+1}\right\}$ and $R=\operatorname{span}\left\{e_{1}, e_{2} \ldots \ldots . . e_{n}, e_{n+1}\right\}$ respectively. Then we have $N^{\perp}=\operatorname{span}\left\{e_{1}, e_{n+2} \ldots \ldots . e_{2 n}, e_{2 n+1}\right\}$ and $R^{\perp}=\operatorname{span}\left\{e_{n+2} \cdots \ldots . . e_{2 n}\right\}$ respectively. Now

$$
\begin{aligned}
& S(V, V)=\left[K\left(e_{1} \wedge e_{2}\right)+K\left(e_{1} \wedge e_{3}\right)+\ldots \ldots+K\left(e_{1} \wedge e_{n+1}\right)\right] \\
+ & {\left[K\left(e_{1} \wedge e_{n+2}\right)+\ldots \ldots \ldots . .+K\left(e_{1} \wedge e_{2 n}\right)+K\left(e_{1} \wedge e_{2 n+1}\right)\right] } \\
= & {\left[\tau(R)-\sum_{2 \leq i<j \leq n+1} K\left(e_{i} \wedge e_{j}\right)\right] } \\
+ & {\left[\tau\left(N^{\perp}\right)-\sum_{n+2 \leq i<j \leq 2 n+1} K\left(e_{i} \wedge e_{j}\right)\right] } \\
= & \tau(R)-\tau(N)+\tau\left(R^{\perp}\right)-\tau\left(N^{\perp}\right) \\
= & {[\tau(R)+\tau(N)]+[b+\tau(N)-c-\tau(R)] } \\
= & b-c .
\end{aligned}
$$

Therefore, $S(V, V)=b-c$, for any unit vector $V \in T_{p} M$, orthogonal to $\xi_{1}$ and $\xi_{2}$. Then we can write for any $1 \leq i \leq 2 n+1, S\left(e_{i}, e_{i}\right)=b-c$, since $S(V, V)=(b-c) g(V, V)$. It follows that $S(X, X)=(b-c) g(X, X)+K_{1} A(X) A(X)+K_{4} D(X, X)$ and $S(Y, Y)=(b-c) g(Y, Y)+$ $K_{2} B(Y) B(Y)+K_{3}[A(Y) B(Y)+B(Y) A(Y)]$ for any $X \in\left[\operatorname{span}\left\{\xi_{1}\right\}\right]^{\perp}$ and $Y \in\left[\operatorname{span}\left\{\xi_{2}\right\}\right]^{\perp}$, where $A, B$ are the dual forms of $\xi_{1}$ and $\xi_{2}$ with respect to $g$, respectively and $K_{1}, K_{2}, K_{3}, K_{4}$ are scalars, such that $K_{1} \neq 0, K_{2} \neq 0, K_{3} \neq 0, K_{4} \neq 0$.

Now from the above equations, we get from symmetry that $S$ with tensors $(b-c) g+K_{1}(A \otimes A)+K_{4} D$
and $(b-c)+K_{2}(B \otimes B)+K_{3}[(A \otimes B)+(A \otimes B)]$ must coincide on the complement of $\xi_{1}$ and $\xi_{2}$, respectively, that is $S(X, Y)=(b-c) g(X, Y)+K_{1} A(X) A(Y)+K_{2} B(X) B(Y)+K_{3}[A(X) B(Y)+$ $B(X) A(Y)]+K_{4} D(X, Y)$, for any $X, Y \in\left[\operatorname{span}\left\{\xi_{1}, \xi_{2}\right\}\right]^{\perp}$. Since $\xi_{1}$ and $\xi_{2}$ are eigenvector fields of $Q$, we also have $S\left(X, \xi_{1}\right)=0$ and $S\left(Y, \xi_{2}\right)=0$ for any $X, Y \in T_{p} M$ orthogonal to $\xi_{1}$ and $\xi_{2}$. Thus, we can extend the above equation to

$$
\begin{align*}
& \left.S(X, Z)=(b-c) g(X, Z)+K_{1} A(X) A(Z)+K_{2} B(X) B(Z)\right) \\
& \quad+K_{3}\left[A(X) B(Z+A(Z) B(X)]+K_{4} D(X, Z)\right. \tag{2.8}
\end{align*}
$$

for any $X \in\left[\operatorname{span}\left\{\xi_{1}, \xi_{2}\right\}\right]^{\perp}$ and $Z \in T_{p} M$, where $K_{1}, K_{2}, K_{3}, K_{4}$ are scalars and $K_{1} \neq 0, K_{2} \neq$ $0, K_{3} \neq 0, K_{4} \neq 0$. Now, let us consider the $n$-plane section $P$ and $(n+1)$-plane section $R$ in $T_{p} M$ as follows $P=\operatorname{span}\left\{e_{1}, e_{2}, \ldots, e_{n}\right\}$ and $R=\operatorname{span}\left\{e_{1}, e_{2}, \ldots, e_{n}, \xi_{1}\right\}$. Then we have $P^{\perp}=\operatorname{span}\left\{\xi_{1}, e_{n+2}, \ldots, e_{2 n+1}\right\}$ and $R^{\perp}=\operatorname{span}\left\{e_{n+2}, \ldots, e_{2 n}, e_{2 n+1}\right\}$ respectively. Now

$$
\begin{aligned}
& S\left(\xi_{1}, \xi_{1}\right)=\left[K\left(\xi_{1} \wedge e_{1}\right)+K\left(\xi_{1} \wedge e_{2}\right)+\ldots \ldots+K\left(\xi_{1} \wedge e_{n}\right)\right] \\
& +\left[K\left(\xi_{1} \wedge e_{n+2}\right)+\ldots \ldots \ldots . .+K\left(\xi_{1} \wedge e_{2 n}\right)+K\left(e_{1} \wedge e_{2 n+1}\right)\right] \\
& =\left[\tau(R)-\sum_{1 \leq i<j \leq n} K\left(e_{i} \wedge e_{j}\right)\right] \\
& +\left[\tau\left(P^{\perp}\right)-\sum_{n+2 \leq i<j \leq 2 n+1} K\left(e_{i} \wedge e_{j}\right)\right] \\
& =\tau(R)-\tau(P)+\tau\left(P^{\perp}\right)-\tau\left(R^{\perp}\right) \\
& =[\tau(R)+\tau(P)]+[a+\tau(P)-c-\tau(R)] \\
& =a-c
\end{aligned}
$$

Therefore we can write

$$
\begin{equation*}
S\left(\xi_{1}, \xi_{1}\right)=(b-c) g\left(\xi_{1}, \xi_{1}\right)+(a-b) A\left(\xi_{1}\right) A\left(\xi_{1}\right)+K_{4} D\left(\xi_{1}, \xi_{1}\right) \tag{2.9}
\end{equation*}
$$

Analogously, let us consider the $n$-plane section $P$ and $N \in T_{p} M$ as follows $P=\operatorname{span}\left\{e_{1}, e_{2}, \ldots \ldots . . e_{n}\right\}$ and $N=\operatorname{span}\left\{e_{n+1}, e_{n+2} \ldots \ldots . e_{2 n}\right\}$ respectively. Then we have $P^{\perp}=\operatorname{span}\left\{e_{n+1}, e_{n+2} \ldots \ldots . . e_{2 n}, \xi_{2}\right\}$ and $N^{\perp}=\operatorname{span}\left\{e_{1}, \ldots \ldots . . e_{n}, \xi_{2}\right\}$ respectively. Now, we have

$$
\begin{aligned}
& S\left(\xi_{2}, \xi_{2}\right)=\left[K\left(\xi_{2} \wedge e_{1}\right)+K\left(\xi_{2} \wedge e_{2}\right)+\ldots . .+K\left(\xi_{2} \wedge e_{n}\right)\right] \\
+ & {\left[K\left(\xi_{2} \wedge e_{n+1}\right)+K\left(\xi_{2} \wedge e_{n+2}\right)+\ldots \ldots . .+K\left(e_{2} \wedge e_{2 n}\right)\right] } \\
= & {\left[\tau\left(N^{\perp}\right)-\sum_{1 \leq i<j \leq n} K\left(e_{i} \wedge e_{j}\right)\right] } \\
+ & {\left[\tau\left(P^{\perp}\right)-\sum_{n+1 \leq i<j \leq 2 n} K\left(e_{i} \wedge e_{j}\right)\right] } \\
= & \tau\left(N^{\perp}\right)-\tau(P)+\tau\left(P^{\perp}\right)-\tau(N) \\
= & {[\tau(N)+b-\tau(P)]+[a+\tau(P)-\tau(N)] }
\end{aligned}
$$

$$
=a+b
$$

Then, we get
$S\left(\xi_{2}, \xi_{2}\right)=(b-c) g\left(\xi_{2}, \xi_{2}\right)+(a+c) B\left(\xi_{2}\right) B\left(\xi_{2}\right)+K_{3}\left[A\left(\xi_{2}\right) B\left(\xi_{2}\right)+A\left(\xi_{2}\right) B\left(\xi_{2}\right)\right]$.

Now from (2.8), (2.9) and (2.10) we can write the Ricci tensor by

$$
\begin{align*}
& \quad S(X, Y)=\mu_{1} g(X, Y)+K_{1} A(X) A(Y)+K_{2} B(X) B(Y) \\
& +  \tag{2.11}\\
& +K_{3}[A(X) B(Y)+A(Y) B(X)]+K_{4} D(X, Y)
\end{align*}
$$

for any $X, Y \in T_{p} M$. From (2.11) it follows that $M$ is a mixed super quasi Einstein manifold , where $\mu_{1}, K_{1}, K_{2}, K_{3}, K_{4}$ are scalars and $K_{1} \neq 0, K_{2} \neq 0, K_{3} \neq 0, K_{4} \neq 0$. Hence the theorem is proved.

Theorem 2.2. A Riemannian manifold of dimension $2 n$ with $n \geq 2$ is mixed super quasi Einstein manifold if and only if the Ricci operator $Q$ has eigen vector fields $\xi_{1}$ and $\xi_{2}$ such that at any point $p \in M$, there exist three real numbers $a, b$ and $c$ satisfying

$$
\begin{aligned}
& \tau(P)+a=\tau\left(P^{\perp}\right) ; \quad \xi_{1}, \xi_{2} \in T_{p} P^{\perp} \\
& \tau(N)+b=\tau\left(N^{\perp}\right) ; \quad \xi_{1} \in T_{p} N, \xi_{2} \in T_{p} N^{\perp} \\
& \tau(R)+c=\tau\left(R^{\perp}\right) ; \quad \xi_{1} \in T_{p} R, \xi_{2} \in T_{p} R^{\perp}
\end{aligned}
$$

for any $n$-plane section $P, N$ and $(n+1)$-plane section $R$ where $P^{\perp}, N^{\perp}$ and $R^{\perp}$ denote the orthogonal complements of $P, N$ and $R$ in $T_{p} M$ respectively and

$$
\begin{gathered}
a=\left\{\beta+\varrho+\delta\left[\sum_{i=n+1}^{2 n-2} D\left(e_{i}, e_{i}\right)+D\left(e_{2 n}, e_{2 n}\right)-\sum_{i=1}^{n} D\left(e_{i}, e_{i}\right)\right]\right\} / 2, \\
b=\left\{2 \alpha-\beta+\varrho+\delta\left[\sum_{i=n+1}^{2 n} D\left(e_{i}, e_{i}\right)-\sum_{i=2}^{n} D\left(e_{i}, e_{i}\right)\right]\right\} / 2, \\
c=\left\{\varrho-\beta+\delta\left[\sum_{i=1}^{n} D\left(e_{i}, e_{i}\right)-\sum_{i=n+1}^{2 n} D\left(e_{i}, e_{i}\right)\right]\right\} / 2,
\end{gathered}
$$

where $\alpha, \beta, \varrho$ and $\delta$ are scalars.

Proof. Let $P$ and $R$ be $n$-plane sections and $N$ be an $(n-1)$-plane section such that, $P=$
$\operatorname{span}\left\{e_{1}, e_{2}, \ldots e_{n}\right\}, R=\operatorname{span}\left\{e_{n+1}, e_{n+2}, \ldots e_{2 n}\right\}$ and $N=\operatorname{span}\left\{e_{2}, e_{3}, \ldots e_{n}\right\}$ respectively. Therefore the orthogonal complements of these sections can be written as $P^{\perp}=\operatorname{span}\left\{e_{n+1}, e_{n+2}, \ldots e_{2 n}\right\}, R^{\perp}$ $=\operatorname{span}\left\{e_{1}, e_{2}, \ldots e_{n}\right\}$ and $N^{\perp}=\operatorname{span}\left\{e_{1}, e_{n+1}, \ldots e_{2 n}\right\}$.
Then rest of the proof is similar to the proof of Theorem 2.1.

Corollary 1. For pseudo generalized quasi Einstein manifold the characterization will be same but the values of $a, b, c$ will be different for both odd and even dimensional manifolds.

## 3. $M S(Q E)_{n}$ with the parallel vector field generators

Theorem 3.1. A mixed super quasi Einstein manifold is pseudo generalized quasi Einstein manifold if either of generators is parallel vector field.
Proof. By the definition of the Riemannian curvature tensor, if $\xi_{1}$ is parallel vector field, then we find that

$$
R(X, Y) \xi_{1}=\nabla_{X} \nabla_{Y} \xi_{1}-\nabla_{Y} \nabla_{X} \xi_{1}-\nabla_{[X, Y]} \xi_{1}=0
$$

and consequently we get
$S\left(X, \xi_{1}\right)=0$.

Again, put $\mathrm{Y}=\xi_{1}$ in the equation (1.2) and applying (1.3) and (1.4), we get

$$
S\left(X, \xi_{1}\right)=(\alpha+\beta) g\left(X, \xi_{1}\right)+\gamma g\left(X, \xi_{2}\right)
$$

So, if $\xi_{1}$ is a parallel vector field, by (3.1), we get

$$
\begin{equation*}
(\alpha+\beta) g\left(X, \xi_{1}\right)+\gamma g\left(X, \xi_{2}\right)=0 \tag{3.2}
\end{equation*}
$$

Now, putting $\mathrm{X}=\xi_{2}$ in the equation (3.2) and using (1.3) we get $\gamma=0$. So, if $\xi_{1}$ is parallel vector field in a mixed super quasi Einstein manifold, then the manifold is pseudo generalized quasi Einstein manifold.

Again, if $\xi_{2}$ is parallel vector field, then $R(X, Y) \xi_{2}=0$. Contracting, we get
$S\left(Y, \xi_{2}\right)=0$.

Putting $\mathrm{X}=\xi_{2}$ in the equation (1.2) and applying (1.3), we get

$$
S\left(Y, \xi_{2}\right)=(\alpha+\varrho) g\left(Y, \xi_{2}\right)+\gamma g\left(Y, \xi_{1}\right)+\delta D\left(Y, \xi_{2}\right) .
$$

If, $\xi_{2}$ is a parallel vector field, by (3.3), we get
$(\alpha+\varrho) g\left(Y, \xi_{2}\right)+\gamma g\left(Y, \xi_{1}\right)+\delta D\left(Y, \xi_{2}\right)=0$.

Putting $\mathrm{Y}=\xi_{1}$ and using (3.4), (1.3), (1.4), we get $\gamma=0$, i.e., the manifold is pseudo generalized quasi Einstein manifold.

## 4. Examples of 3-dimensional and 4- dimensional mixed super quasi Einstein manifold

Example 4.1. Let us consider a Riemannian metric $g$ on $R^{3}$ by

$$
\left.d s^{2}=g_{i j} d x^{i} d x^{j}=\left(x^{3}\right)^{4 / 3}\left[\left(d x^{1}\right)^{2}+\left(d x^{2}\right)^{2}\right)\right]+\left(d x^{3}\right)^{2}
$$

$(i, j=1,2,3)$ and $x^{3} \neq 0$. Then the only non-vanishing components of Christofell symbols, the curvature tensors and the Ricci tensors are

$$
\begin{gathered}
\Gamma_{13}^{1}=\Gamma_{23}^{2}=\frac{2}{3 x^{3}}, \quad \Gamma_{11}^{3}=\Gamma_{22}^{3}=-\frac{2}{3}\left(x^{3}\right)^{\frac{1}{3}} \\
R_{1331}=R_{2332}=-\frac{2}{9\left(x^{3}\right)^{\frac{2}{3}}}, \quad R_{1221}=\frac{4}{9}\left(x^{3}\right)^{\frac{2}{3}} \\
R_{11}=R_{22}=\frac{2}{9\left(x^{3}\right)^{\frac{2}{3}}}, \quad R_{33}=-\frac{4}{9\left(x^{3}\right)^{2}}
\end{gathered}
$$

Let us consider the associated scalars $\alpha, \beta, \varrho, \gamma$ and $\delta$ and the associated tensor $D$ as follows:

$$
\alpha=-\frac{4}{9\left(x^{3}\right)^{2}}, \quad \beta=\frac{5\left(x^{3}\right)^{\frac{4}{3}}}{9}, \quad \varrho=\frac{7}{9\left(x^{3}\right)^{2}}, \quad \gamma=-\frac{1}{\left(x^{3}\right)^{\frac{5}{3}}}, \quad \delta=\frac{1}{15\left(x^{3}\right)^{\frac{5}{3}}},
$$

and

$$
D_{i j}=\left\{\begin{array}{ccc}
\frac{5}{3} x^{3} & \text { for } & i=j=1 \\
-\frac{5}{3} x^{3} & \text { for } & i=j=2 \\
\frac{5}{\left(x^{3}\right)^{\frac{1}{3}}} & \text { for } & i=1, j=2 \\
\frac{15}{\left(x^{3}\right)^{\frac{1}{3}}} & \text { for } & i=2, j=1 \\
0 & \text { for } & \text { otherwise }
\end{array}\right.
$$

the 1-form

$$
A_{i}(x)=\left\{\begin{array}{cll}
\frac{1}{x^{3}} & \text { for } \quad i=1 \\
0 & \text { for } & \text { otherwise }
\end{array} \quad \text { and } \quad B_{i}(x)=\left\{\begin{array}{cll}
\left(x^{3}\right)^{\frac{2}{3}} & \text { for } \quad i=2 \\
0 & \text { for } & \text { otherwise }
\end{array}\right.\right.
$$

Then we have

$$
(i) R_{11}=\alpha g_{11}+\beta A_{1} A_{1}+\varrho B_{1} B_{1}+\gamma\left[A_{1} B_{1}+A_{1} B_{1}\right]+\delta D_{11}
$$

$$
\begin{aligned}
& (i i) R_{22}=\alpha g_{22}+\beta A_{2} A_{2}+\varrho B_{2} B_{2}+\gamma\left[A_{2} B_{2}+A_{2} B_{2}\right]+\delta D_{22} \\
& (i i i) R_{33}=\alpha g_{33}+\beta A_{3} A_{3}+\varrho B_{3} B_{3}+\gamma\left[A_{3} B_{3}+A_{3} B_{3}\right]+\delta D_{33}
\end{aligned}
$$

Since all the cases other than $(i)-(i i i)$ are trivial, we can say that
$R_{i j}=\alpha g_{i j}+\beta A_{i} A_{j}+\varrho B_{i} B_{j}+\gamma\left[A_{i} B_{j}+A_{j} B_{i}\right]+\delta D_{i j} \quad$ for $i, j=1,2,3$. Thus if $\left(R^{3}, g\right)$ is a Riemannian manifold endowed with the metric given by

$$
\left.d s^{2}=g_{i j} d x^{i} d x^{j}=\left(x^{3}\right)^{4 / 3}\left[\left(d x^{1}\right)^{2}+\left(d x^{2}\right)^{2}\right)\right]+\left(d x^{3}\right)^{2}
$$

$(i, j=1,2,3)$ and $x^{3} \neq 0$, then $\left(R^{3}, g\right)$ is an $M S(Q E)_{3}$.
Next we consider the Lorentzian metric $g$ on $R^{3}$ by
$\left.d s^{2}=g_{i j} d x^{i} d x^{j}=-\left(x^{3}\right)^{4 / 3}\left(d x^{1}\right)^{2}+\left(x^{3}\right)^{4 / 3}\left(d x^{2}\right)^{2}\right)+\left(d x^{3}\right)^{2}, \quad(i, j=1,2,3)$ and $x^{3} \neq 0$.
Now, by similar way after some construction of associated scalars and associated 1-forms, we can say that the manifold is a mixed super quasi-Einstein manifold. Therefore we get another example of $M S(Q E)_{3}$.

Example 4.2. $\left(R^{3}, g\right)$ is a Lorentzian manifold endowed with the metric given by

$$
\left.d s^{2}=g_{i j} d x^{i} d x^{j}=-\left(x^{3}\right)^{4 / 3}\left(d x^{1}\right)^{2}+\left(x^{3}\right)^{4 / 3}\left(d x^{2}\right)^{2}\right)+\left(d x^{3}\right)^{2}
$$

$(i, j=1,2,3)$ and $x^{3} \neq 0$, then $\left(R^{3}, g\right)$ is an $M S(Q E)_{3}$.
Example 4.3. Let us consider a Riemannian metric $g$ on $R^{4}$ by

$$
d s^{2}=g_{i j} d x^{i} d x^{j}=(1+2 p)\left[\left(d x^{1}\right)^{2}+\left(d x^{2}\right)^{2}+\left(d x^{3}\right)^{2}+\left(d x^{4}\right)^{2}\right]
$$

$(i, j=1,2,3,4)$ and $p=\frac{e^{x^{1}}}{k^{2}}, k$ is constant, then the only non-vanishing components of Christofell symbols, the curvature tensors and the Ricci tensors are

$$
\begin{gathered}
\Gamma_{22}^{1}=\Gamma_{33}^{1}=\Gamma_{44}^{1}=-\frac{p}{1+2 p} \\
\Gamma_{11}^{1}=\Gamma_{12}^{2}=\Gamma_{13}^{3}=\Gamma_{14}^{4}=\frac{p}{1+2 p} \\
R_{1221}=R_{1331}=R_{1441}=\frac{p}{1+2 p} \\
R_{11}=\frac{3 p}{(1+2 p)^{2}}, \quad R_{22}=R_{33}=R_{44}=\frac{p}{(1+2 p)^{2}}
\end{gathered}
$$

It can be easily seen that the scalar curvature $r$ of the given manifold $\left(R^{4}, g\right)$ is $r=\frac{6 p}{(1+2 p)^{3}}$, which is non-vanishing and non-constant.

Let us consider the associated scalars $\alpha, \beta, \varrho, \gamma$ and $\delta$ and the associated tensor $D$ as follows:

$$
\alpha=\frac{p}{(1+2 p)^{3}}, \quad \beta=2 p, \quad \varrho=-\frac{p}{(1+2 p)^{2}}, \quad \gamma=-\frac{2 \sqrt{ } p}{1+2 p}, \quad \delta=-\frac{2}{(1+2 p)^{2}}
$$

and

$$
D_{i j}=\left\{\begin{array}{ccc}
p & \text { for } & i=j=1 \\
-p & \text { for } & i=j=3 \\
0 & \text { for } & \text { otherwise }
\end{array}\right.
$$

the 1-form

$$
A_{i}(x)=\left\{\begin{array}{cll}
\frac{1}{1+2 p} & \text { for } & i=1 \\
0 & \text { for } & \text { otherwise }
\end{array} \quad \text { and } \quad B_{i}(x)=\left\{\begin{array}{cll}
\sqrt{ } p & \text { for } & i=1 \\
-\sqrt{ } p & \text { for } & i=3 \\
0 & \text { for } & \text { otherwise }
\end{array}\right.\right.
$$

Then we have

$$
\begin{aligned}
& (i) R_{11}=\alpha g_{11}+\beta A_{1} A_{1}+\varrho B_{1} B_{1}+\gamma\left[A_{1} B_{1}+A_{1} B_{1}\right]+\delta D_{11} \\
& (i i) R_{22}=\alpha g_{22}+\beta A_{2} A_{2}+\varrho B_{2} B_{2}+\gamma\left[A_{2} B_{2}+A_{2} B_{2}\right]+\delta D_{22} \\
& (i i i) R_{33}=\alpha g_{33}+\beta A_{3} A_{3}+\varrho B_{3} B_{3}+\gamma\left[A_{3} B_{3}+A_{3} B_{3}\right]+\delta D_{44} \\
& (i v) R_{44}=\alpha g_{44}+\beta A_{4} A_{4}+\varrho B_{4} B_{4}+\gamma\left[A_{4} B_{4}+A_{4} B_{4}\right]+\delta D_{44}
\end{aligned}
$$

Since all the cases other than $(i)-(i v)$ are trivial, we can say that
$R_{i j}=\alpha g_{i j}+\beta A_{i} A_{j}+\varrho B_{i} B_{j}+\gamma\left[A_{i} B_{j}+A_{j} B_{i}\right]+\delta D_{i j}$, for $i, j=1,2,3,4$.
so if $\left(R^{4}, g\right)$ be a Riemannian manifold endowed with the metric given by

$$
d s^{2}=g_{i j} d x^{i} d x^{j}=(1+2 p)\left[\left(d x^{1}\right)^{2}+\left(d x^{2}\right)^{2}+\left(d x^{3}\right)^{2}+\left(d x^{4}\right)^{2}\right]
$$

$(i, j=1,2,3,4)$. and $p=\frac{e^{x^{1}}}{k^{2}}, k$ is constant, then $\left(R^{4}, g\right)$ is an $M S(Q E)_{4}$ with non-zero and non-constant scalar curvature.

If we consider the Lorentzian metric $g$ on $R^{3}$ by

$$
d s^{2}=g_{i j} d x^{i} d x^{j}=-(1+2 p)\left(d x^{1}\right)^{2}+(1+2 p)\left[\left(d x^{2}\right)^{2}+\left(d x^{3}\right)^{2}+\left(d x^{4}\right)^{2}\right]
$$

$(i, j=1,2,3,4)$ and $p=\frac{e^{x^{1}}}{k^{2}}, k$ is constant. Now, by similar way after some construction of associated scalars and associated 1 -forms, we can say that the manifold is a mixed super quasi-Einstein manifold. Therefore we get another example of $M S(Q E)_{4}$.

Example 4.4. Let $\left(R^{4}, g\right)$ be a Lorentzian manifold endowed with the metric given by

$$
d s^{2}=g_{i j} d x^{i} d x^{j}=-(1+2 p)\left(d x^{1}\right)^{2}+(1+2 p)\left[\left(d x^{2}\right)^{2}+\left(d x^{3}\right)^{2}+\left(d x^{4}\right)^{2}\right]
$$

$(i, j=1,2,3,4)$ and $p=\frac{e^{x^{1}}}{k^{2}}, k$ is constant. Then $\left(R^{4}, g\right)$ is an $M S(Q E)_{4}$ with non-zero and non-constant scalar curvature.

## 5. Examples of warped product on mixed super quasi-Einstein manifold

Example 5.1. Here we consider the example 4.1, a 3-dimensional example of mixed super quasiEinstein manifold. Let $\left(R^{3}, g\right)$ be a Riemannian manifold endowed with the metric given by
$\left.d s^{2}=g_{i j} d x^{i} d x^{j}=\left(x^{3}\right)^{4 / 3}\left[\left(d x^{1}\right)^{2}+\left(d x^{2}\right)^{2}\right)\right]+\left(d x^{3}\right)^{2}$, where $(i, j=1,2,3)$ and $x^{3} \neq 0$.
To define warped product on $M S(Q E)_{3}$, we consider the warping function $f: R \backslash 0 \longrightarrow(0, \infty)$ by $f\left(x^{3}\right)=\left(x^{3}\right)^{\frac{2}{3}}$ and observe that $f=\left(x^{3}\right)^{\frac{2}{3}}>0$ is a smooth function. The line element defined on $R \backslash\{0\} \times R^{2}$ which is of the form $B \times_{f} F$, where $B=R \backslash\{0\}$ is the base and $F=R^{2}$ is the fibre.

Therefore the metric $d s_{M}^{2}$ can be expressed as $d s_{B}^{2}+f^{2} d s_{F}^{2}$ i.e.,

$$
d s^{2}=g_{i j} d x^{i} d x^{j}=\left(d x^{3}\right)^{2}+\left\{\left(x^{3}\right)^{2 / 3}\right\}^{2}\left[\left(d x^{1}\right)^{2}+\left(d x^{2}\right)^{2}\right],
$$

which is the example of Riemannian warped product on $M S(Q E)_{3}$.

Example 5.2. We consider the example 4.3, a 4-dimensional example of mixed super quasi-Einstein manifold. Let $\left(R^{4}, g\right)$ be a Riemannian manifold endowed with the metric given by
$d s^{2}=g_{i j} d x^{i} d x^{j}=(1+2 p)\left[\left(d x^{1}\right)^{2}+\left(d x^{2}\right)^{2}+\left(d x^{3}\right)^{2}+\left(d x^{4}\right)^{2}\right]$, where $(i, j=1,2,3,4), p=\frac{e^{x^{1}}}{k^{2}}, k$ is constant.

To define warped product on $M S(Q E)_{4}$, we consider the warping function $f: R^{3} \longrightarrow(0, \infty)$ by $f\left(x^{1}, x^{2}, x^{3}\right)=\sqrt{ }(1+2 p)$ and we observe that $f>0$ is a smooth function. The line element defined on $R^{3} \times R$ which is of the form $B \times_{f} F$, where $B=R^{3}$ is the base and $F=R$ is the fibre.

Therefore the metric $d s_{M}^{2}$ can be expressed as $d s_{B}^{2}+f^{2} d s_{F}^{2}$
i.e., $\quad d s^{2}=g_{i j} d x^{i} d x^{j}=(1+2 p)\left[\left(d x^{1}\right)^{2}+\left(d x^{2}\right)^{2}+\left(d x^{3}\right)^{2}\right]+[\sqrt{ }(1+2 p)]^{2}\left(d x^{4}\right)^{2}$,
which is the example of Riemannian warped product on $M S(Q E)_{4}$.
